Welcome to HTML

1 Apa Itu HTML ?

HTML atau HyperText Markup Language merupakan sebuah bahasa markap untuk membuat halaman web atau sebuah bahasa yang menggunakan markap atau penanda untuk membuat halaman web.

Penanda atau markap ini, nanti akan kita sebut dengan Tag.

HTML berperan untuk menentukan struktur konten dan tampilan dari sebuah web.

Kalau kita ibaratkan nih..

HTML itu seperti batu bata untuk membangun rumah. Batu bata ini dapat disusun, hingga menjadi fondasi dasar.

2 Bagaimana Cara Kerja HTML ?

Dokumen HTML adalah file yang diakhiri dengan ekstensi .html atau .htm. Ekstensi file ini bisa dilihat dengan menggunakan web browser apa pun (seperti Google Chrome, Safari, atau Mozilla Firefox). Browser tersebut membaca file HTML dan me-render kontennya sehingga user internet bisa melihat dan membacanya..

Biasanya, rata-rata situs web menyertakan sejumlah halaman HTML yang berbeda-beda. Contohnya, beranda utama, halaman 'tentang kami', halaman kontak yang semuanya memiliki dokumen HTML terpisah.

Masing-masing halaman HTML terdiri atas seperangkat tags (bisa disebut juga elements), yang mengacu pada building block halaman website. Tag tersebut membuat hirarki yang menyusun konten hingga menjadi bagian, paragraf, heading, dan block konten lainnya.

HTML CANVAS

The HTML `<canvas>` element is used to draw graphics on a web page.

The graphic to the left is created with `<canvas>`. It shows four elements: a red rectangle, a gradient rectangle, a multicolor rectangle, and a multicolor text.

What is HTML Canvas?

The HTML `<canvas>` element is used to draw graphics, on the fly, via JavaScript.

The `<canvas>` element is only a container for graphics. You must use JavaScript to actually draw the graphics.

Canvas has several methods for drawing paths, boxes, circles, text, and adding images.

What is HTML Canvas?

The HTML `<canvas>` element is used to draw graphics, on the fly, via JavaScript.

The `<canvas>` element is only a container for graphics. You must use JavaScript to actually draw the graphics.

Java Methods

A **method** is a block of code which only runs when it is called.

You can pass data, known as parameters, into a method.

Methods are used to perform certain actions, and they are also known as **functions**.

Why use methods? To reuse code: define the code once, and use it many times.

Create a Method

A method must be declared within a class. It is defined with the name of the method, followed by parentheses (). Java provides some pre-defined methods, such as `System.out.println()`, but you can also create your own methods to perform certain actions:

Example

Create a method inside Main:

```
public class Main {
    static void myMethod() {
        // code to be executed
    }
}
```
